1 Introduction

- Evolution is a process of gradual change that take place over many generations.Necessity and requirement of anything is reason of evolution.Similarly when we need something new for improving healthcare ,system , evolution come in existence. Between the years 1750 and 2000, healthcare in the United States evolved from a simple system of home remedies and itinerant doctors with little training to a complex scientific , technological, and bureaucratic system often called the " medical industrial complex".The complex is built on medical science and technology.

1.1 Technological Advancement-

The introduction of wearable biometric devices that provide patients with information about their own health and telemedicine apps allow patients to easily access care no matter where they live. With new technologies focused on monitoring, research, and healthcare availability, patients will be able to take a more active role in their care.Some other invention include Robotics,Nanotechnology,genome sequencing,Augmented Reality.

1.2 Hospitals and Doctors role-

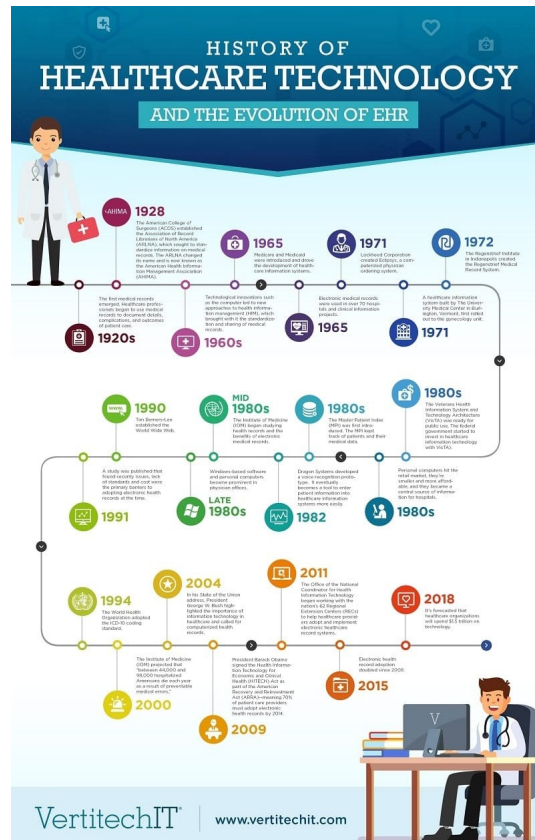

Nowadays,hospitals are building with all new technologies with well equipped machinery.All doctors are properly trained before treating a patient.Nowadays researcher are searching new medicines for diseases and modifying old medicines into new ones.

1.3 Old Methods and Use Today-

India, the land of Ayurveda, has a wide variety of special treatments to offer. In addition, there are hospitals practicing modern medicine that provide quality service at an affordable cost. When compared to the expense of medical treatment in Western countries.

1.4 Insurance Facility-

Most developed countries have a widespread insurance network in the healthcare sector. But, in India, the insurance industry is only now picking up. The percentage of the Indian population having health insurance policies is very low, and there are very few companies offering insurance in the healthcare sector. Nonetheless, it is expected that insurance will play a major role in the Indian healthcare system in the near future.

2 Conclusion

- Today,an optimized level of "health" whatever the definition might be , is fathomable and achievable if given unlimited resources.The problem lies in that resources are not unlimited , and are in fact disproportionately allocated between demographic groups.A value-based system, designed to provide a high quality of health care for the lowest cost ,is a solution to the growing crisis of healthcare system.A major problem with value- based care , however is that these health outcomes are subjective and determined by individual patient needs values.A new definition of health which incorporates a description of well - being , specific patient needs, and the organisational ,value based system required to satisfy those needs,is now necessary.The evolution should maintain-

1. Expanded primary health facility to everyone.
2. Cheap and all morden facility to needed person.
